Q. Given 3 integer n, a, b & return n^{th} magical number. Since ans would be very large return mod 10^9+7

A +ve integer is a magical no. when number is divisible by either a or b.

Approach

We will count the magical number by iterating the count with increasing a & b equally if (a<b) a+=a & if (b<a) b+=b that how we cant count till its not equal to n

Pseudo Code:

```
while (count != n) {
    if (a < b) {
        count++;
        a+=a;
    }
    else if (b<a) {
        count++;
        b+=b;
    }
    else {
        count++;
        a+=a
    }
}
return count;
```
